DAY 19 OF 30

See it. Then act on it.

Real-Time Dashboards and Activator.
From watching data to responding to it.

- Live tiles
- Rules
- Alerts

THE PROBLEM

A dashboard only helps if someone is looking at it.

1	**2 p.m.**	The line turns red
2	**2:01 p.m.**	Nobody is at the screen
3	**5 p.m.**	Someone notices

Three hours lost, **with the answer on display the whole time**.

THE SIMPLE VERSION

A smoke alarm, not a window.

You could watch the kitchen through a window all day. Or you could fit a smoke alarm and get on with your work.

A dashboard is the **window**. Activator is the **alarm**.

✓ **Dashboard**	Shows what is happening now
✓ **Activator**	Watches for a condition
✓ **Action**	Tells someone, or starts a job

HOW IT WORKS

From event to action

1. A **tile** on the dashboard is one KQL query
2. **Live refresh** updates it when new data arrives
3. An **Activator rule** watches a value or a pattern
4. When it is met, it sends **email or a Teams message**
5. Or it runs a **pipeline, notebook or Power Automate flow**

No polling loop to write

You describe the condition. Fabric keeps checking it for you.

FOR ENGINEERS

Designing rules that people trust

Alert on change, not on state

"Temperature crossed 80" fires once. "Temperature is above 80" fires all afternoon.

Many things can feed a rule

Eventstreams, KQL queries, Power BI visuals, dashboards and Fabric events can all trigger Activator.

Close the loop automatically

The best rule does not page a person. It starts the job that fixes the problem.

Live refresh saves compute

Tiles re-query when new data is ingested, instead of on a fixed timer.

THE HONEST PART

Alert or just a report?

SET AN ALERT

Someone must respond within minutes

The condition is clear and measurable

There is a defined next step

A REPORT IS ENOUGH

The number is reviewed weekly

Nobody knows what to do when it fires

The threshold is a guess

> **The catch:** alert fatigue. Ten alerts a day and people mute the channel. One meaningful alert a week gets acted on. Fewer, sharper rules win.

FROM REAL WORK

Live monitoring on a real project

Quality control for a manufacturing group, using computer vision on the production line.

1. **A vision model** detected fibre defects automatically
2. **Inspection time** went from 10 hours to 10 seconds
3. **Image and sensor telemetry** was stored in KQL and OneLake
4. **The factory floor** was monitored live from that data

When the answer arrives in seconds, **people can act while it still matters**.

Swipe →

SAVE THIS

See and act in five lines

1. **Dashboards** show the present moment
2. **Each tile** is a query on live data
3. **Activator** watches so people do not have to
4. **Actions** can notify or start a job
5. **Few, sharp alerts** beat many noisy ones

Tomorrow: Semantic models.
One agreed meaning for every number.
