DAY 26 OF 30

Know before they do

Monitoring in Fabric.
Find the problem before the users.

Monitoring hub **Metrics app** **Alerts**

THE PROBLEM

"The dashboard is wrong" is a bad way to find out.

1	**2 a.m.**	A pipeline fails quietly
2	**8 a.m.**	Reports show yesterday's data
3	**9 a.m.**	A director emails you

The platform knew at 2 a.m. **Nobody had asked it to say so.**

THE SIMPLE VERSION

A car dashboard.

You do not open the bonnet every morning. A few dials and warning lights tell you when something needs attention.

Monitoring gives your platform **the same dials and warning lights**.

✓ **Did it run?**	Job status and history
✓ **Is it healthy?**	Duration and failures
✓ **Can we afford it?**	Capacity usage

HOW IT WORKS

Where to look

1. **Monitoring hub**: every run of every pipeline, notebook and refresh
2. **Capacity Metrics app**: who used how much compute
3. **Workspace monitoring**: detailed logs you can query with KQL
4. **Activator**: turn any of this into an alert

Three questions

Did it run, is it getting slower, and is it eating the capacity? Answer those and you cover most incidents.

FOR ENGINEERS

What each tool is good for

Monitoring hub is your first stop

It lists runs across the workspace with status and duration. Start every investigation here.

The Metrics app looks back 14 days

Compute history covers 14 days and storage 30. Longer trends need your own copy.

The Metrics app has no alerts

To be warned about capacity, use capacity events in Real-Time hub with Activator.

Surge protection is a safety net

It limits background work when the capacity is under pressure, protecting interactive users.

THE HONEST PART

What deserves an alert?

ALERT ON	JUST LOG
A production pipeline failing	Every successful run
A refresh taking twice as long as usual	Failures in development workspaces
Capacity nearing its limit	Warnings nobody acts on

> **The catch:** a job that succeeds can still be wrong. It ran, it wrote zero rows, and everything is green. Monitor the data, not only the job.

WATCH OUT

Four checks that catch most problems

1 **Freshness**: when did this table last get new rows?

2 **Volume**: is today's row count in the normal range?

3 **Duration**: is the job slower than last week?

4 **Capacity**: what was running when throttling began?

Good monitoring is **four questions, asked automatically**.

Swipe →

SAVE THIS

Monitoring in five lines

1. **Monitoring hub** for what ran
2. **Metrics app** for what it cost
3. **Workspace monitoring** for the details
4. **Activator** to be told, not to check
5. **Watch the data**, not only the jobs

Tomorrow: Faster Spark jobs. Where the time really goes.
