DAY 28 OF 30

Ask your data a question

AI on Fabric.
What works, and what it depends on.

Data agents **Copilot** **AI functions**

THE PROBLEM

Most people cannot write a query.

1	**The question**	"Why did sales drop in the north?"
2	**The path**	Ask an analyst, wait three days
3	**The answer**	Arrives after the decision

The data exists. **The distance between the question and the answer is the problem.**

THE SIMPLE VERSION

An analyst who knows where everything is.

A good analyst hears a question in normal language, knows which table holds the answer, writes the query and explains the result.

A data agent does that same job, **on the data and definitions you give it.**

✓ **You ask**	In everyday language
✓ **It finds**	The right tables and measures
✓ **It answers**	With the query it used

HOW IT WORKS

The AI pieces in Fabric

1. **Copilot** helps you build: code, queries, reports
2. **Fabric data agents** answer questions on your data
3. **AI functions** summarise, classify and extract inside a pipeline
4. **Custom agents** can be built on the same data with Azure OpenAI

Grounded, not guessing

An agent writes a query against your real tables. The answer comes from the data, not from the model's memory.

FOR ENGINEERS

What decides whether it works

The semantic layer does the heavy lifting

Clear table names, descriptions and agreed measures matter more than which model you pick.

Data agents have limits

An agent takes up to five sources and is read-only. Scope it to one subject area, not the whole company.

Security still applies

The agent respects the permissions of the person asking. Row and column rules still decide what comes back.

Copilot needs paid capacity

It is on by default for paid Fabric capacities from F2 up, and not available on trial.

THE HONEST PART

Is your data ready for AI?

READY WHEN	NOT YET WHEN
Gold tables are clean and documented	Column names are cryptic codes
KPIs have one agreed definition	Three tables claim to be "sales"
Access rules are already in place	Nobody can say which number is right

> **The catch:** an agent makes a bad data model fail faster and more confidently. It will answer every question, including the ones your data cannot support.

FROM REAL WORK

AI agents on real projects

Two assistants, both built on governed data in Fabric.

1. **An HR assistant** for leaders, built with Azure OpenAI and LangChain
2. It answered questions on **attrition, performance and workforce metrics**
3. **An insight agent** for executives on real-time sales and logistics data
4. It used **Agentic-RAG** on Fabric Real-Time Intelligence

In both, the model was the easy part. **The data foundation was the work.**

SAVE THIS

AI on Fabric in five lines

1. **Copilot** helps builders work faster
2. **Data agents** answer business questions
3. **AI functions** enrich data in pipelines
4. **Security** applies to the agent too
5. **A clean model** is what makes it useful

Tomorrow: Migration.
Moving an old warehouse without losing anything.
