DAY 30 OF 30

The full picture

Thirty days, one architecture.
How every piece fits together.

THE PROBLEM

Thirty topics are hard to hold in your head.

1	**Each piece**	Makes sense on its own
2	**The question**	Where does it sit?
3	**The risk**	Using tools without a design

A platform is not a list of features. **It is how they connect.**

THE SIMPLE VERSION

The whole kitchen, in one view.

On day one I called Fabric a fitted kitchen. Over thirty days we opened every cupboard.

Now step back to the doorway and look at the **whole room at once**.

✓ **Deliveries**	Data coming in
✓ **The pantry**	OneLake, stored once
✓ **The pass**	Reports, alerts and answers going out

THE MAP

One platform, end to end

Ingest
Pipelines, Copy job, mirroring, shortcuts, Eventstream

Store
OneLake, Delta tables, Lakehouse and Warehouse

Transform
Spark notebooks, dataflows, medallion layers

Serve
Semantic models and Direct Lake

Real time
Eventhouse, dashboards, Activator

Ask
Data agents and Copilot

OneLake underneath
Every stage reads and writes the same Delta tables. Nothing is copied between tools.

Across everything · capacity, security, governance, CI/CD and monitoring

FOR ENGINEERS

If I started tomorrow

Design capacity and workspaces first

Decide what shares compute and who owns what before any data lands.

Pick the write path by team skills

Lakehouse for Spark teams, Warehouse for SQL teams, both where it helps.

Keep tables healthy

Compaction and V-Order on serving tables. Direct Lake and reports depend on it.

Put security on the data

Define access once, as close to the tables as possible, and test as a restricted user.

THE HONEST PART

What Fabric is, and is not

IT GIVES YOU	YOU STILL BRING
One platform instead of six services	A clear data model and definitions
One copy of the data in an open format	Ownership for every important table
Batch, real time, BI and AI together	The discipline to monitor and maintain

> **The honest summary:** Fabric removes the plumbing between tools. It does not remove the engineering. Good platforms are still designed, not purchased.

FROM REAL WORK

Where I have used all of this

Four platforms, four industries, the same building blocks.

1. **People analytics**: Lakehouse, medallion layers, security, a GenAI assistant
2. **Consumer delivery**: Eventstream, Eventhouse, real-time agents
3. **Manufacturing**: gateways, hybrid pipelines, governance
4. **Quality control**: computer vision with live telemetry

The tools repeat. **The design is what changes.**

SAVE THIS

Thirty days in five lines

1. **Store once** in OneLake, as Delta
2. **Layer it**: Bronze, Silver, Gold
3. **Serve it** through a semantic model
4. **Secure and govern** it on the data
5. **Watch** capacity, tables and freshness

What next: your call.
Tell me which topic deserves a deeper series.
